ENGRAVING MACHINERY & PRECISION TOOLS

Gravers are shaped to suit specific needs & must be sharpened before use.

FLAT EDGE

Flat Gravers have a flat cutting edge with either parallel or slightly tapered sides. They're useful for removing or texturing backgrounds, bright-cutting, block lettering, & cutting consistent width lines for borders.

KNIFE EDGE

Knife Gravers have straight sides that taper to a very sharp point. They produce deep, narrow cuts making them great for fine-line engraving and for removing excess metal from around stone settings.

ROUND EDGE

Round Gravers have a round cutting edge with either parallel or slightly curved sides. They're used primarily for raising & rolling beads for stone setting or cutting smooth curves when engraving or chasing.

ONGLETTE

Onglette Gravers have a cutting edge that comes to a fine point and curved sides. They're used for stone setting, line engraving, lettering, & inlay work. Perfect for cutting smooth curves & fine lines.

BEVEL

Bevel Gravers feature straight sides that are either parallel or slightly tapered. The cutting edges form a V shape, which is similar to Square Gravers but more narrow. They're great for deep, bold cuts & block lettering.
